ACKNOWLEDGEMENTS

We gratefully acknowledge Dr. K. Sankar, Director SACON for his encouragement and support throughout the study. We thank the Forest department team lead by Mr. A. Periyasamy, IFS. DFO, Salem, for being extremely cooperative and helpful during our field studies at the forests of Manjavadi Gats area. Mr. Venkatesan, Range forest officer, Pappareddipalayam is acknowledged for all his support and guidance during the reconnaissance survey and for establishing the field station. Mr. P T Mohan, Project Director NHAI PIU-Kancheepuram, Mr. Ashutosh Samant Singhar (IFS), Retd. APCCF, Joint Advisor, NHAI, R.O. Chennai, Mr. Srinagesh M., Assistant Manager (Environment) Feedback and Dr. Raj Kumar Singh, General Manager (Environment) of Feedback Infra Private Limited are acknowledged for providing all the background information regarding the proposed highway project and assistance in the field. Forest guards Mr. K. Perumal and Mr. Palanivel, and the Forest watcher Mr. Sukumar are acknowledged for local assistance and support provided for SACON's research team in the field. Dr. Rajah Jayapal, Mr. Harif Parengal, Mr. Anoop V,, Mr. Sethu M R, Ms. Binisha Balan and Mr. Pavan C, of SACON are acknowledged for all the academic inputs and cooperation during the study and report writing. Mr. Govindan, and Mr. Ramesh, of Vellaiyappan kovil are acknowledged for the field assistance provided during the field studies at Manjavadi Ghats area.

EXECUTIVE SUMMARY

The National Highways Authority of India (NHAI) proposes to develop an eight lane access controlled greenfield corridor of 277.3 km between Chennai and Salem in Tamil Nadu. The proposal was considered by the Environment Appraisal Committee (EAC) of the Union Ministry of Environment, Forest and Climate Change (MOEF&CC) during its 195th meeting on 31st August 2018. The committee *inter alia* suggested an additional study on the impact of proposed alignment specifically on the Mountain ecosystem (hilly region) from a reputed agency. Further to the request received in this regard from the NHAI, SACON undertook a six month study on the impact of the proposed eight-lane Chennai-Salem Greenfield Corridor on the Mountain Ecosystems (hilly regions).

The study was conducted along the alignment of the proposed road focusing intensive studies on the 2.8 km road stretch at Manjavadi Ghat section, that pass through the major hill forest area between the hills of Kalrayan and Shevaroy. The proposed road alignment at this area falls along the existing Salem-Harur State highway. Implementation of the proposed eight lane highway would primarily involve expansion of this existing state highway here.

During the present study, we conducted intensive field studies for four months (January to April 2019), after an initial reconnaissance in December 2018. We documented the faunal and floral species occurring in the project area covering 500 m on either side of the proposed Road alignment, using standard methods. Our results indicated that the area harbours a good biodiversity including several conservation important floral and faunal taxa. The area would require careful planning and implementation during the development of the proposed eight lane road along this stretch, in order to minimize the impacts and ensuring connectivity of habitat and free movement of wildlife between the forests of Kalrayan and Shevaroy.

A fully elevated road (viaduct) over the 2.8 km stretch at Manjavadi Ghats is suggested for the sake of best habitat connectivity and minimal impacts on the wildlife. Alternatively, we suggest three animal passes, each of 300 m wide along the 2.8 km stretch as the minimal requirement for effective habitat connectivity and wildlife movement across the proposed eight lane road at the Manjavadi Ghats area. Integration of rainwater harvesting mechanisms along with road construction and appropriate camouflaging of the pillars of the overpasses/ viaduct are also suggested.
